currently learning Java

TOOLS

REST APIs
Git
Telegram Bot API
Google Maps API

AI-NATIVE DEV

Cursor
Claude
OpenAI API
integrated into daily workflow as core development tools

EDUCATION

ČVUT Prague
Faculty of Electrical Engineering (FEL)
Software Engineering and Technology (SIT)
Bachelor's programme

ABOUT

Builder-first developer who ships products out of curiosity, not obligation. I use Cursor and Claude as daily force multipliers to move from idea to a working prototype at any time. With a solid foundation in JavaScript and rapid adaptability (ready to dive into TypeScript and any new stack), I'm looking to bring my huge interest in AI-powered automation and product thinking to Make's AI & Integrations team.

PROJECTS

AI-Powered Client Outreach Tool

Python, Google Maps API, OpenAI API | Collaborative project, in progress

- ▶ Architecting an end-to-end automation pipeline that scrapes business data from Google Maps, enriches leads with AI-generated personalized messages, and delivers outreach at scale.
- ▶ Designed the integration layer between Maps API, LLM processing, and delivery channels — reducing manual prospecting effort by an estimated 90%.
- ▶ Built with a product mindset: focused on “why does a user need this?” before writing a single line of code.

AI Telegram Bots & Mini-Apps

Python, Telegram Bot API, OpenAI API, JS | Personal / Production

- ▶ Developed multiple production Telegram bots with integrated AI capabilities — from conversational assistants to task-specific mini-applications.
- ▶ Iterated rapidly using AI-assisted development (Cursor + Claude), shipping features in hours instead of days.

Wuide — Travel Guide Platform

HTML, CSS, JavaScript, PHP | University semester project (ČVUT)

- ▶ Built a travel planning web app enabling users to register, leave reviews, find like-minded travelers, compare destinations, and share trip plans — delivered as part of a team in an agile university setting.

EstateShine — Cleaning Service Landing Page

HTML, CSS, JavaScript | Freelance / Custom project

- ▶ Designed and developed a modern, high-converting landing page for a cleaning service, featuring responsive layouts, clean UI components, and a smooth scroll-based user experience optimized for lead generation.
- ▶ Implemented performance-focused front-end architecture with semantic HTML, modular CSS, and lightweight JavaScript interactions — achieving fast load times and seamless rendering across all devices.
